

## Environmental Communications position

Marine research and policy development organization seeking dynamic and engaged staff member versed in:

- Communications and community outreach
- Simple IT - Wordpress and website management
- Salesforce
- Vertical Response

Ocean Conservation Research is a small scientific research and policy development organization focused on understanding the scope of, and exploring solutions to the growing problem of human generated noise pollution and its impact on marine animals.

Our product includes critical writing on the issues to inform the public (newsletter and articles), our engagement in the marine conservation and bioacoustic community – presentations at scientific conferences, critiques on environmental impact statements, and other larger projects that will gather and synthesize marine acoustical data, and convey the information to the public and policymakers in a clear, actionable format.

Currently we are only speaking to a relatively small subscribed constituency (~2300 subscribers) and whatever fallout that happens from that by way of social media and media bylines. We need to greatly expand that audience and become much more visible on the horizon. The job position would be to reach out to press, media, and the public to make our work more central to the public discussion on marine conservation.

We are located in San Rafael but have an international reach. We are preparing to launch a Spanish Language website and are in the process of burnishing our current websites. We would prefer a local, in-office staff person to leverage the synergy of an “on tap” team.
